

# 5082 POL Application Notes

The 5082 series are radiation hardened, non-isolated, synchronous switching buck point of load (POL) regulators.

Non-isolated DC-DC converters are three terminal devices, having an input terminal, an output terminal and a common terminal.

Buck converters generate an output voltage that is lower than the input voltage,

In simplest form, the buck converter uses a FET, a diode and an inductor.

In order to obtain higher power efficiency, the rectifying diode in the non-isolated DC-DC converter is replaced with a second FET. The forward voltage drop of the diode is usually higher than the drop across the second FET, therefore power losses are lower. The FET must be switched in synchronism with the waveform that would appear across the diode. Therefore, DC-DC converters that use a second FET to perform the action of the diode are called synchronous rectification devices.

## Simplified Block Diagram

The 5082 is a two-phase buck regulator. This means that there are two switching sections that are phase-staggered 180 degrees from each other. This effectively raises the input and output ripple frequency and reduces the amount of external ripple filtering that would otherwise be needed.

The block diagram of the model 5082 shows that input power is fed through a common mode inductor and applied to two power switch stages, each stage consisting of an upper switch and a lower switch. Each upper switch stage is driven at a 100 kHz rate by the pulse width modulator (PWM) circuit. However, due to the 180 degree phase staggering, the ripple is at 200 kHz.

Each switched waveform is then fed through it's own buck choke.

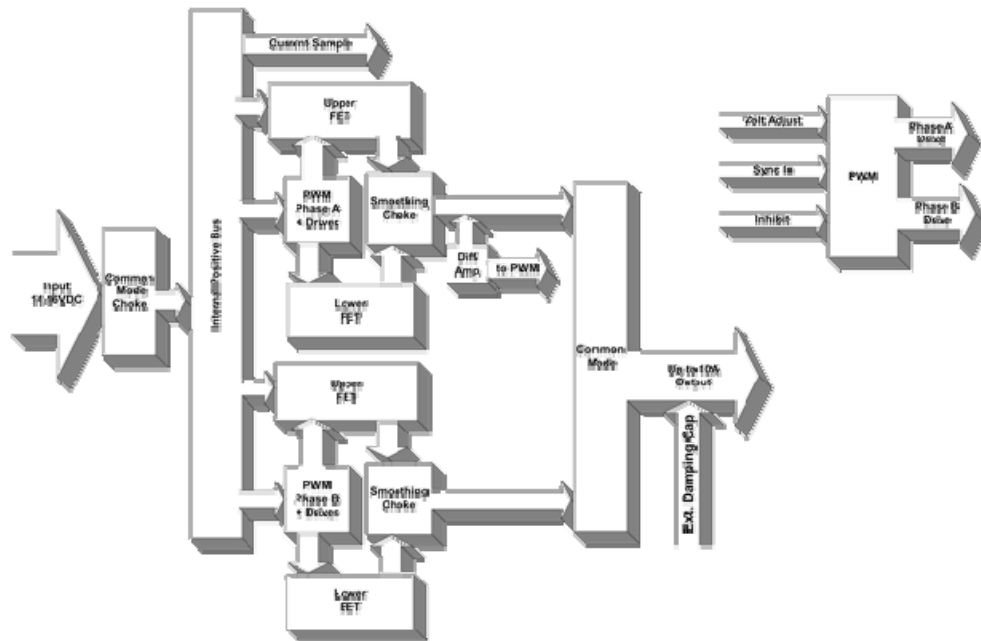

A lower switch on each power stage is connected in parallel with the output buck rectifier. The lower switch is connected between the upper switch output and ground.

The ripple filtered output passes through a common mode inductor to reduce output spike voltages. The external damping capacitor is supplied by the user to optimize load application and removal transients as well as to lower the output ripple.

The output voltage is passed through the output sense circuit, which permits voltage sensing directly at the 5082's output pins for best static load regulation.

Input pins are provided for external sync (this can also be used for phase staggering of multiple 5082's), an inhibit pin and a voltage adjust pin. Output pins include a 5 VDC voltage reference (for output voltage adjustment, a BIT analog output and a current telemetry output (useful in paralleling multiple converters).

### Input Voltage Source:

The 5082 converters are intended to operate from an intermediate bus. This intermediate bus is a voltage of 11 to 16 VDC (with a preferred voltage of 12 VDC) that is supplied by another, front-end power converter. The front-end power converter developing the intermediate bus is exposed to the bus variations and transients. Also, it is expected that the front-end converter will accommodate the MIL-STD-461 type EMI filtering requirements of the system, as applicable.

Although the 5082 converters do not contain full internal EMI filters, they do feature common mode filtering on input and output power lines. This provides a substantial reduction of voltage spikes.

A fully loaded 5082 module can draw up to 1000 mA ripple current at its switching frequency of 200 kHz. Therefore, any front end DC-DC converter should provide appropriate decoupling capacitance at its output terminals to supply this maximum ripple current. A minimum input decoupling capacitance of 30 microfarads (ceramic MLC or low ESR types) per 5082 module is recommended.

Modular Devices, Inc.

 www.mdipower.com • Tel 631.345.3100 • Fax 631.345.3106

For most applications, an input voltage source that is nominally 12 VDC will provide the best electrical performance. A nominal 15 VDC source may also be used, however, the conversion efficiencies will be slightly lower.

### **Output Voltage:**

Output voltage types and adjustment ranges are shown on the 5082 data sheet.

### **Output Current:**

Output current of the 5082 units is limited to 12 amperes or to the current produced at 20 watts output (considering the nominal output voltage), whichever is lower. The maximum output current is constant current limited.

### **External Output Capacitance:**

Due to the small size of the 5082, the internal output capacitance is limited in value to that necessary for high frequency filtering. For good dynamic load transient response, the 5082 data sheet shows a recommended minimum and maximum external capacitance that should be supplied by the user or present in the user's load. The use of low ESR types, such as multiple solid Tantalum chips in parallel is encouraged, as ripple voltage will also be reduced.

### **Output Voltage Temperature Coefficients**

Voltage limits for Model 5082 parts shown in the MDI data sheets are the nominal 25°C values. At temperatures outside 25°C, the output voltage may vary +/- 100PPM/°C maximum with base temperature.

### **Output Ripple**

Due to its small size, the internal capacitance of the 5082 is limited. For good load removal and load application response, a minimum value of external capacitance is recommended.

When selecting external capacitors, low ESR solid tantalum capacitors are preferred. Capacitor leads with excessive series inductance should not be used, since this will add impedance and negate the benefit of the external capacitance. Relatively large amounts of external capacitance may be added, but do not exceed the data sheet guidelines without consulting MDI.

### **Four Terminal Capacitor Method for Improved Filtering**

To reduce high frequency spikes, multilayer ceramic capacitors in surface mount chip form can be used. For best results, the capacitor should be connected as a four terminal device (see illustration on previous page). An external series common mode inductor or ferrite beads can also be used between the converter and the capacitor.

### **Output Ripple Vs. Temperature**

The fundamental output ripple of the 5082 converters is primarily dependent on the absolute capacitance value of the external output capacitors (when the output capacitors are multilayer ceramic types), or the ESR of the output capacitors (when the output capacitors are solid tantalum types). The selection of output capacitor depends on the output voltage and type of converter. However, the following effects occur at temperature. For units using ceramic output capacitors, the capacitance falls off sharply at high and low temperature extremes. Although the low ESR of ceramic capacitors results in very low ripple voltages, it is not unusual for ripple voltage to double at the high and low temperature extremes. For units using solid tantalum output capacitors, the ESR also rises sharply at low temperature extremes.

Therefore, users should conservatively assume a ripple temperature coefficient of 1% per °C increase over the 25°C base numbers.

### **Short Circuit and Overload Protection**

Model 5082 DC/DC converters contain constant current limiting for protection against inadvertent output short circuits and overloads. The current limiting set point is approximately 125% of rated output current.

### **Output Over Voltage Protection**

Model 5082 DC/DC converters do not contain any internal over voltage protection circuitry. If this function is required, the user should implement it externally. Because the 5082 is non-isolated, in the extremely unlikely event of a failed shorted switching FET, the input voltage could appear at the output pins. If warranted, external OVP should be used.

## Output Load Transient response

The output load removal and load application transient voltage is a function of the external capacitance and the magnitude of the current step. The following table lists the magnitude of the output voltage transient for a 25% to 75% rated load change, with the minimum recommended external capacitance.

Nom.Vout	Max I out	Ext C (min.), uF	Zout (ohms)	Delta V for 50% step	Ext C (max.), uF	Zout (ohms)	Delta V for 50% step
5	4	1000	0.15	0.3	2000	0.1	0.2
3.3	6	1000	0.15	0.45	4000	0.1	0.3
2.5	8	2000	0.05	0.2	4000	0.035	0.14
2	10	2000	0.05	0.25	4000	0.035	0.14
1.8	10	2000	0.05	0.25	4000	0.035	0.14
1.5	10	2000	0.05	0.25	4000	0.035	0.14
1.2	10	3000	0.03	0.15	6000	0.022	0.11
1	10	3000	0.03	0.15	6000	0.022	0.11

## Back Voltage

A back voltage may be applied to the output of the 5082 DC/DC Converter, whether it be energized or de-energized. Up to 20% above the output voltage rating may be safely applied.

## Pin Functions

Pin 1	Positive Input Power Pin
Pin 2,3	Input/Output Common
Pin 4,5	Output
Pin 6	Case Ground
Pin 7	V ref: A nominal +5 VDC reference used for output voltage trimming
Pin 8	Adjust: Input pin used for voltage trimming and paralleling
Pin 9	I out: Signal proportional to output current, for telemetry or paralleling
Pin 10	Sync Input: Input pin used to accept external 100 kHz sync signal
Pin 11	BIT: An analog output line indicating the module status
Pin 12	Inhibit

## Voltage Reference (Pin 7)

The voltage reference pin is primarily used for downward voltage adjustment of the output. However, it may also be used for other applications. Up to 2 milliamperes may be drawn by the user. This current, if drawn, reflects on the input current.

## Output Voltage Adjustment (Pin 8)

The adjust pin function allows the user to set the 5082 output voltage slightly above or below it's initial set point. The recommended adjust range for each part type is listed in the data sheet.

When trimming for an increased output magnitude the adjust resistor is connected to the common ground. When trimming for a decreased output magnitude the adjust resistor is connected to the V ref pin (pin 13).

The adjust pin is connected to an internal 249K resistor, whose purpose is to prevent damage to the internal circuits and to reduce noise pickup.

The following table gives applicable resistor values for each 5082 type, as well as which equations to use to calculate the external adjust resistor value. For purposes of computing the external adjust resistor power dissipation, a maximum of 2.5 VDC appears across the external adjustment resistor.

If the external adjust feature is not used, both the adjust pin (8) and the V ref pin (7) should be left unconnected.

When the converter is adjusted upwards, the output power should be limited to 20 watts, or the output current should be limited to 10 amperes, whichever is less.

Vout	R1	R2	R3	Equation for Upward Adjust	Equation for Downward Adjust
5	44.9K	49.9K	249K	Equations 1A and 3	Equations 2A and 3

Equation 1A 
$$\frac{V_{Adj} - 2.5}{R_1} = \frac{2.5}{R_2} + \frac{2.5}{R_4}$$

Equation 1B 
$$\frac{2.5 - V_{Adj}}{R_1} = \frac{2.5}{R_2} - \frac{2.5}{R_4}$$

Equation 2A 
$$\frac{V_{Adj} - 2.5}{R_1} = \frac{2.5}{R_2} + \frac{2.5}{R_4}$$

Equation 2B 
$$\frac{2.5 - V_{Adj}}{R_1} = \frac{2.5}{R_2} + \frac{2.5}{R_4}$$

Equation 3 
$$R_3 = R_4 - 249k$$

### Output Current (Pin 9)

An analog of the output current is provided. This is useful for telemetry or in paralleling applications.

#### Model 5082 Pin 9 millivolts per output ampere scaling

Nom. Vout	Vin=12 VDC	Vin=15 VDC
5	83	67
3.3	57	46
2.5	45	36
2	36	29
1.8	33	27
1.5	28	23
1.2	22	18
1	20	16

### Sync Input (Pin 10)

Pin 10 is the Sync Input. The 5082 hybrid operates at approximately 100 kHz and may be synchronized to frequencies from 95 to 105 kHz. The sync input pulse should meet the following levels as shown in the diagram. The sync input should sit at nominal zero VDC and transition to +5 VDC at a 5% ± 1% duty cycle. It should be noted that the

Modular Devices, Inc.  
One Roned Road • Shirley, New York 11967  
www.mdipower.com • Tel 631.345.3100 • Fax 631.345.3106

internal oscillator runs at the switching frequency. Other frequencies are also available on special order. Contact MDI's Sales and Marketing Department for other sync frequencies.

Synchronizing the power conversion units within an extremely sensitive system ensures that any noise generation is coincident with the system clock.

If two or more 5082 units are used, a phase staggered sync signal may be applied in order to reduce the overall input and output ripple. The "sync pin" should be left open if unused.

### Typical Sync Waveform

#### BIT (Pin 11)

The BIT signal is an analog output that is nominally 0.5 VDC or less if the POL is in current limit and nominally 2.5 VDC during normal operation.

The BIT line may be connected to an external comparator window detector to produce a discrete BIT signal.

#### Inhibit (Pin 12)

Pin 12 is the Inhibit pin.

To inhibit the output voltage, the inhibit input should be connected to a positive voltage in excess of 1.2 VDC. The maximum inhibit voltage should be limited to 5.4 VDC. The impedance of the inhibit pin is approximately 7 Kohms.

Therefore, the inhibit pin may be safely driven by standard 3.3 or 5 VDC logic devices.

When not inhibited, pin 12 should either be left floating or returned to ground.

## Efficiency of 5082 POL Converters

Dual FET synchronous rectification and non-isolated design afford very high operating efficiencies for the 5082 series POL converters. Even very low operating voltages of 1.2Vdc or less achieve typical efficiencies exceeding 75 percent, while models with outputs of 3.3Vdc and higher reach 82 percent or more. The characteristic curves below give graphic representation of typical efficiencies achieved as a function of load at 12Vdc input.

#### Some advice about protection of sensitive loads

The 5082 POL converters comprise a non-isolated circuit design; there is no inherent galvanic barrier that isolates the input bus from the output side of the converter. Under

Modular Devices, Inc.  
One Roned Road • Shirley, New York 11967  
www.mdipower.com • Tel 631.345.3100 • Fax 631.345.3106

some circumstances of overstress or failure originating outside the converter, the converter itself may fail short circuit, effectively coupling input to output for some duration. Therefore, the user should assess the application risk to the loads under such conditions and make provisions to implement OVP, zener clamps or voltage suppression components as may be deemed necessary. Please contact the factory for assistance.
